

INSJACK-S® Smart Covers are insulation blankets that can diagnose mechanical insulation failures in minutes by temperature sensors integrated to the system.

The failure of one unmonitored valve or steam trap can cost a lot while remaining undetected. Conventional methods for maintenance could be very expensive, especially when confined spaces are involved. INSJACK-S® Smart Covers can become a member of your maintenance team by alerting for relevant temperature changes.

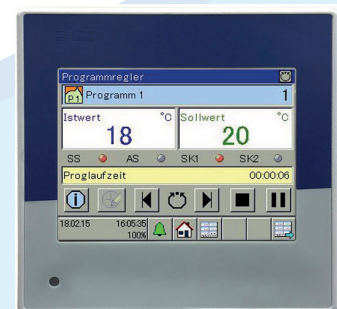

Wireless sensors on cover can measure the temperature, another unit receives the data and serves it to the process controller. This device has a connection with main server and an easy interface lets to set up text messages or e-mails after temperatures measured out of the range.
